

ABSTRACT OF THE DISCLOSURE

A user interface which is easier to operate in that, when a user performs printing setting, a plurality of setting items divided into a plurality of sheets can be set together in one package with no need of setting the setting items separately.

In an information processing apparatus for producing printing data, which is interpretable by a printer, based on document data produced by an application, when printing setting is performed to produce the printing data by using the plurality of setting sheets, a plurality of setting items separated into the plurality of setting sheets are combined into a combined setting, and the combined setting is registered in a combined setting list. When one of the combined settings registered in the combined setting list is selected, all the setting items of the one combined setting are set and displayed in a plurality of setting sheets.
